Composition II

80% of students reported listening to music while studying or doing academic work (Nielsen, 2017). Music is becoming a reliable source for students to stay focused and to manage stress. Music is an art of sound in time that expresses ideas and emotions in significant forms through the elements of rhythm, melody, harmony, and color. This rising trend to listen to music while studying or working has attracted many researchers and made them ask, does music actually help students to perform better? If yes, how does music do that? Some studies suggest that music can improve memory, attention, and motivation (Hallam et al., 2002; Angel, Polzella, & Elvers, 2010). “Background music in schools can help students to settle into academic stuff more quickly” (Ritblatt et al. (2013)). “Individuals who hear music while working experience a better mood and more perceived work quality compared to those who work in silence” (Lesiuk, 2005). With the help of these studies, it can be argued that music can be beneficial for students. In contrast to the beneficial effects of listening to music whilst studying, people also argue that music can be distracting depending on the task. The kind of music that is being played decides the conclusion

of the following argument. For instance, Rock 'n' Roll music, jazz or R&D type of music can be distractions. Types of music also matter. The essay takes reference to silent music and will explain the positive impact of music and how music can be helpful for students. Especially in today's generation as students face high pressure, struggle to concentrate, and low attention span. The motivation to choose this topic is that, in the current generation, the majority of individuals do not know the positive impact of music and treat music more like distraction, which is not the truth. Acknowledging the importance of music can be helpful for these individuals. This essay focuses on the positive effects of music, especially silent music regarding student concentration and learning, and how music helps them to reduce anxiety and manage mental health. In the First part of the paper the essay investigates the reasons why students choose to study with music mainly focuses on background music, and finally the essay will explain the positive effects of music and how music contributes to improving students' mental health and overall performance

Silent music helps students stay focused and improves their ability to concentrate more powerfully whilst studying. Studies have shown that any type of background music, which basically contains soft as well as calm music without words, can help students to remember things better. According to Hallam, Price, and Katsarou (2002), students who study with calm background music perform memory tasks better than students who work in silence. Music clearly cuts background noises like people talking or sounds from outside and makes a pleasant environment for individuals to focus on their given tasks. Students feel happier when they listen to music and feel less tired or bored while working (Angel, Polzella, & Elvers, 2010). Also, Lesiuk (2005). Feeling happier makes students feel less worn out and this helps them to utilize more time to study. It is important to choose the

right type of music while studying or it can distract students. For instance, rock music or music which contains words can be disturbing. Silent music or music which does not contain many words is better because music with too many words can make students think about the lyrics (Ritblatt et al., 2013). Calm silent music keeps the mind relaxed but still awake, which helps students to focus. In today's world students get easily distracted by phones notifications and sounds around them. Listening to music can help them avoid distractions. Arousal-mood hypothesis is a concept in psychology which suggests that music helps people to work better by making them feel good and keeping their mind alert while studying (Thompson, Schellenberg, & Husain, 2001). When students listen to music sometimes, they go into a state which is known as a flow state. The meaning of flow state means a state when the mind becomes fully focused on a particular task and forgets about time. This state helps students to study longer with full concentration. In summary, music helps students to fully concentrate on their tasks, it also helps them to feel calm and do better in their studies. These are some of the reasons why students choose music while studying or doing academic work. Silent music is one of the useful genres that can help students to learn, especially for students who find it difficult to concentrate.

Another positive effect of music is that it impacts students' mental health, makes them positive and makes them feel less anxious. In the current generation, students need to deal with school homework and tasks, higher competition, and family expectations. Listening to music might help students feel emotionally better and relax. "Music in schools and academic workplace helps students to feel calm and give a little relief from stress" (Ritblatt et al., 2013). When students listen to music in school, it diverts their minds and makes them feel fresh. This helps students to feel less stressed. Music can slow down the

heartbeat, which makes the body feel relaxed and gives a fresh feeling. This helps students to feel less nervous before attempting exams or classes. On the other hand, music can be a way for students to subsist with feelings of loneliness. It is difficult for students to express all their feelings to someone else. In these terms music acts as a friend and while listening to music it feels like having a friend with them. Emotional support is important, mainly for students who are not living with their family and friends or studying abroad. Thompson, Schellenberg, and Husain (2001) demonstrate that music does not only helps to concentrate, but it also helps to improve mood and thinking. This shows that music does not only help the brain but also helps mental health. Music also helps students to build good habits. For instance, if a student always listens to music while studying then just listening to music can become an excuse to study. This makes students start studying and stay focused. In short, music does not only help students to concentrate, but it also helps them to manage stress, mental health and improve their overall performance.

To sum up all the things that have been stated so far, music is ultimately one of the best ways which can help to improve concentration, manage stress, and keep a healthy mind. Listening to music might help students to overcome loneliness. Silent music can help students in terms of school related academic work and music overall can help them to improve their character, overcome fears, and become better. The First part of the paper the essay investigated the reasons why students choose to study with silent background music and how it impacts students positively, and finally the essay explained how music contributes to improving students' mental health and overall performance. In spite of the fact that people think that music can distract students, it is not

always true. The right genre of music can be a helpful tool for students. Music can help students study better and manage their mental health at the same time.
